

SWARM

Execution Roadmap · 0 → 100,000,000

Many units. One intention.

01 · Phase 0

Study. Simulation. Capability accumulation.

No hardware manufacturing. No large team. No massive fundraising.

02 · Phase 1

Build:

- wildfire detection systems
- autonomous verification
- property resilience network
- subscription model

Target: high-value private territories.

03 · Phase 2

Deploy small real-world pilots.

Goals:

- collect telemetry
- reduce false positives
- improve autonomy logic
- validate retention

04 · Phase 3

Build territorial intelligence.

Multiple properties become connected.

The network itself starts becoming valuable.

05 · Phase 4

Introduce micro-response capability.

- precision suppression
- hotspot mitigation
- autonomous escalation logic

The system transitions from sensing to acting.

06 · Phase 5

Government integration.

Only after:

- real deployments
- reliability
- data advantage
- operational credibility

07 · Phase 6

SWARM evolves into:

distributed autonomous resilience infrastructure.

The moat becomes:

- telemetry

- coordination systems
 - interoperability
 - operational data
 - deployment density
- 

08 · Toward 100M+

The path to large scale is not: better drones.

The path is: better coordination infrastructure.

The network becomes the product.

Quiet. Precise. Already arrived.
