

SWARM

First 60 Days · Execution Plan

Capability first. Narrative second.

01 · Objective

The first 60 days are about capability accumulation. Not fundraising. Not cinematic marketing.

Primary objective: enter the autonomy systems domain as fast as possible.

02 · Technical Focus

Main focus areas:

- Python
- ROS2
- simulation systems
- computer vision
- distributed systems
- autonomy logic
- drone APIs

03 · Month 1

Month 1 builds foundations.

Actions:

- study drone autonomy systems
- learn ROS2 basics
- build simple agent simulations
- understand telemetry flows

- study wildfire operational workflows

04 · Month 2

Month 2 builds realism.

Build:

- wildfire detection simulation
- multi-agent coordination logic
- event-triggered drone deployment
- telemetry dashboard
- environmental mapping system

05 · First Simulation

The first SWARM simulation must demonstrate:

- anomaly detection
- autonomous verification
- coordinated drone movement
- mission allocation
- telemetry visualization

The simulation should feel operational. Not cinematic.

06 · Biggest Risks

Avoid:

- branding-only progress
- fake technical demos
- changing direction constantly
- trying to look bigger than reality

07 · Correct Identity
